

AI Music Video Prompt Guide

The exact prompts & workflow to create AI music videos with just your phone

The Workflow

1. Record a simple performance video on your phone (anywhere -- we'll change the background)
2. Gather 5 reference images: your selfie, the outfit, the location, a pose reference, and a car/prop
3. Go to auroraperformancestudio.com -> Create Studio -> Image tab
4. Upload your 5 reference images
5. Copy & paste the prompt below -- swap the details for YOUR look
6. Generate your base image
7. Use short re-angle prompts to create different camera shots from your base image
8. Go to Motion Control -> upload your AI image + your phone recording -> animate it

The Secret: You're not just making one image -- you're building a full scene, then shooting it from multiple angles. One prompt = unlimited shots. That's how you get a full music video from AI.

Prompt #1: The Base Scene -- 5 Reference Images

Step 1: Gather Your 5 Reference Images

- Image 1 -- Your Selfie: Clear face shot. AI uses this to match your exact features, skin tone, and likeness.
- Image 2 -- Your Outfit: Flat lay or photo of the clothes you want. Describe each piece in the prompt.
- Image 3 -- Your Location: Where you want to be. A building, street, studio -- whatever fits your vibe.
- Image 4 -- Pose Reference: A photo showing the pose, camera angle, and staging you want. This controls the shot.
- Image 5 -- Prop/Car: A car, bike, or any prop you want in the background. Makes the scene feel real.

Step 2: Copy & Customize The Prompt

PROMPT -- COPY & PASTE

Create a hyper-realistic composite image using the five provided reference images. Use the man from the selfie as the primary identity source, preserving his exact facial features, skin tone, beard texture, hairstyle, eye detail, and overall likeness with absolute accuracy. Replace the person in the pose reference with this subject while keeping the same pose, body positioning, framing, perspective, and camera angle exactly. Dress the subject in the exact outfit from the outfit reference. Place the subject outdoors in front of the location from the building reference as the background, and incorporate the luxury car from the car reference positioned behind the subject naturally. Include a vintage hanging microphone at mouth level, staged identically to the reference. Apply true cinematic shallow depth of field so the subject and microphone stay in razor-sharp focus while the background is softly blurred with natural

Optical bokeh: Match the visual style of imagery shot on an ARRI Alexa cinema camera using a high-quality prime lens. Implement advanced skin realism: authentic pores, subtle texture, fine lines, natural asymmetry. Ultra-photorealistic, seamless blending, 4K resolution, no text or logos.

[!] REPLACE: outfit description, location, car/prop, pose reference. KEEP all technical photography terms exactly.

Step 3: Swap These Parts For YOUR Scene

- Outfit: Replace with your outfit (e.g. 'black leather jacket, ripped jeans, and Jordan 4s')
- Location: Replace with your spot (e.g. 'graffiti warehouse', 'downtown skyline', 'recording studio')
- Car/Prop: Replace with your flex (e.g. 'matte black Hellcat', 'vintage Cadillac', 'motorcycle')
- Gender: Change 'the man' to 'the woman' if needed
- Facial features: Adjust beard/hair details for your own features

Don't Change These: Keep all the technical photography terms (ARRI Alexa, bokeh, skin realism, etc.) -- that's what makes the output look cinematic. Only swap the parts that describe YOUR specific scene.

Prompt #2: Get More Camera Angles

Once you have your base image, create different angles with simple prompts. Upload your base image as reference, then use:

PROMPT -- COPY & PASTE

SIDE PROFILE: super close up, from the side front angle of the man, keep bokeh depth of field

WIDE SHOT: wide shot from behind the subject, showing full environment, keep cinematic depth of field

LOW ANGLE: low angle looking up at the subject, dramatic perspective, keep bokeh depth of field

CLOSE-UP: extreme close-up on the face, eyes looking into camera, shallow depth of field

OVER SHOULDER: over the shoulder shot from behind, looking at the scene ahead, cinematic bokeh

DUTCH ANGLE: tilted dutch angle, dynamic composition, dramatic cinematic lighting

Pro Tip: Generate 3-5 different angles from your base scene. Then use Motion Control to animate each one with your original phone recording. Now you have a multi-shot AI music video -- different angles, same scene, all from one prompt.

Final Step: Animate It With Motion Control

1. Go to auroraperformancestudio.com -> Motion Control
2. Upload your AI-generated image as the Source Image
3. Upload your original phone recording as the Control Video
4. Choose your resolution and hit Generate
5. Your AI music video is ready!

The Power Move: Do this for each angle you generated. Edit them together and you have a full multi-shot music video -- all from one phone recording and some reference images.
