

AI Luxury Car Music Video Guide

Put yourself in a Maybach without leaving your couch -- then animate it with Motion Control

The Concept

Generate a photorealistic image of yourself inside a luxury car interior (Maybach, Rolls Royce, Bentley -- whatever you want). Then record a video of yourself performing in the same position and use Motion Control to animate the AI scene with your real movements. The result looks like a cinematic music video shot inside a luxury vehicle -- from your living room.

The Secret: Position matching is everything. Film yourself in the exact same seated angle as the AI-generated image. This gives Motion Control a perfect lock on your body, so the luxury interior stays stable while you perform naturally.

What You Need -- 3 Reference Images

- Image 1 -- COMPOSITION: A reference photo showing the exact camera angle and framing -- someone sitting in a car seen through the window. This sets the composition.
- Image 2 -- LUXURY INTERIOR: The luxury car interior you want -- Maybach starlight ceiling, quilted leather, ambient LEDs. This sets the vibe.
- Image 3 -- YOUR IDENTITY: A clear photo of yourself. Locks in your exact facial features, skin tone, outfit, and style.

Phase 1: Generate the AI Scene

1. Go to auroraperformancestudio.com -> Create Studio -> Image Generation
2. Upload 3 reference images: Image 1 (composition), Image 2 (luxury interior), Image 3 (your identity)
3. Write your prompt (see below) -- be extremely specific about preserving facial identity
4. Hit Generate
5. Review -- make sure your face looks accurate and the interior matches. Re-generate if needed.

PROMPT -- COPY & PASTE

Use Image 1 as the composition reference, Image 2 as the luxury Maybach interior reference, and Image 3 as the identity reference. Replace the person in Image 1 with the man from Image 3 while preserving his exact facial identity -- same facial structure, skin tone, beard, lips, eye shape, and proportions. He is seated naturally in the backseat of the vehicle, viewed through the slightly lowered car window, maintaining the same camera angle as Image 1. He must be wearing the same outfit from Image 3, relaxed posture with hands resting naturally. Transform the vehicle interior to match the ultra-luxury Maybach interior from Image 2: white quilted leather executive seats, luxury center console, ambient LED lighting, fiber-optic starlight headliner ceiling, ultra-premium limousine atmosphere. Cinematography: ARRI Alexa 35

Phase 2: Record Your Motion Reference Video

1. Study the AI-generated image -- note the exact seated position, camera angle, and body framing
2. Film yourself performing/rapping in the same seated position, matching the angle as closely as possible
3. Keep your body within frame the same way it appears in the AI image

[!] Position Matching is Critical: The closer your real video matches the AI image's angle and framing, the better Motion Control will lock on. Background and outfit in the reference video don't matter -- only position and movement.

Phase 3: Motion Control

1. Go to auraperformancestudio.com -> Create Studio -> Motion Control
2. Upload the AI-generated scene image as the source image
3. Upload your motion reference video as the motion source
4. Write a context prompt (see below) -- crucial for preventing artifacts
5. Hit Generate

PROMPT -- COPY & PASTE

Motion Control Context Prompt:
A man rapping inside of a car

[TIP] Keep the motion prompt short and descriptive. It just needs to know you're INSIDE a car so it constrains movement correctly and prevents hands from morphing through the window.

Customization -- Make It Your Own

- Luxury Vehicle: Rolls Royce, Bentley, Lamborghini, private jet -- any luxury setting
- Interior Details: Red leather, wood trim, champagne holders -- describe the interior you want
- Camera Angle: Front seat, through windshield, interior POV -- any angle that looks fire
- Lighting/Mood: Golden hour, neon city reflections, dark moody, sunset
- Action: Singing, vibing, looking out window -- whatever fits your track

Luxury Vehicle Ideas

- Mercedes-Maybach S-Class -- Starlight headliner, white quilted leather, champagne cooler, ambient LEDs. The ultimate rap video car.
- Rolls Royce Ghost/Phantom -- Starlight ceiling, lambswool floor mats, bespoke everything. Old money energy.
- Lamborghini Urus -- Alcantara interior, Y-shaped vents, aggressive red/black. High energy tracks.
- Bentley Continental GT -- Diamond-quilted leather, rotating display, wood veneer. Smooth R&B vibes.
- Private Jet Interior -- Cream leather seats, oval windows, wood grain. Boss level.

Pro Tips

The ARRI + Cooke Prompt Trick: Mentioning specific cinema cameras (ARRI Alexa 35) and lenses (Cooke anamorphic) triggers the AI to apply cinematic color science, natural skin tones, and realistic lens characteristics. This separates 'AI image' from 'cinematic photo.'

Night Scenes Hit Harder: Luxury car interiors look best at night -- the ambient LEDs and starlight ceiling create natural contrast against the dark exterior. Daytime works but nighttime = automatic mood.

Multiple Cars, One Session: Record ONE performance video, then generate different luxury interiors with the same identity photo. One take = Maybach, Rolls, Lambo, private jet -- unlimited scenes.

Common Mistakes to Avoid

- Not matching position -- If your video angle doesn't match the AI image, Motion Control will struggle
- No context prompt -- Without 'inside a car', hands and body parts can morph through the window
- Too much movement -- Keep it natural. Subtle head movements, hand gestures within frame.
