

SNIPLY STUDIO

AI Luxury Car Music Video Guide

Put yourself in a Maybach without leaving your couch — then animate it with Motion Control

⚡ The Concept

Generate a photorealistic image of yourself inside a luxury car interior (Maybach, Rolls Royce, Bentley — whatever you want). Then record a video of yourself performing in the same position and use **Motion Control** to animate the AI scene with your real movements. The result looks like a cinematic music video shot inside a luxury vehicle — from your living room.

💡 **The Secret:** Position matching is everything. Film yourself in the exact same seated angle as the AI-generated image. This gives Motion Control a perfect lock on your body, so the luxury interior stays stable while you perform naturally. The context prompt ("a man rapping inside of a car") prevents hands and body from morphing outside the window frame.

📦 What You Need

3 REFERENCE IMAGES → AI IMAGE → MOTION VIDEO → FINAL SCENE

IMAGE 1 — COMPOSITION

A reference photo showing the exact camera angle and framing you want — someone sitting in a car seen

IMAGE 2 — LUXURY INTERIOR

The luxury car interior you want — Maybach starlight ceiling, quilted

IMAGE 3 — YOUR IDENTITY

A clear photo of yourself. This locks in your exact facial features, skin tone,

through the window. This sets the composition.

leather, ambient LEDs, starlight headliner. This sets the vibe.

outfit, and style for the face swap.

Step-by-Step Walkthrough

Phase 1: Generate the AI Scene (Nano Banana Pro)

- 1 Head to sniply.studio → Create Studio → **Image Generation**
- 2 Select **Nano Banana Pro** model
- 3 **Upload 3 reference images:** Image 1 (composition), Image 2 (luxury interior), Image 3 (your identity/face)
- 4 Write your prompt (see below) — be extremely specific about preserving facial identity and transforming the interior
- 5 Hit **Generate** ~11 credits
- 6 **Review the output** — make sure your face looks accurate and the interior matches the luxury reference. Re-generate if needed.

✓ AI-Generated Scene Result

Face swapped into luxury Maybach interior — starlight ceiling, quilted leather, ambient LEDs, cinematic shallow DOF

PROMPT 1 — SCENE IMAGE GENERATION (NANO BANANA PRO)

NANO BANANA PRO PROMPT (EXACT)

Use Image 1 as the composition reference, Image 2 as the luxury Maybach interior reference, and Image 3 as the identity reference for the person. Replace the person in Image 1 with the man from Image 3 while preserving his exact facial identity — same facial structure, skin tone, beard, lips, eye shape, and proportions. His face must match the identity reference one-to-one without altering facial features. He is seated naturally in the backseat of the vehicle, viewed through the slightly lowered car window, maintaining the same camera angle and framing as Image 1. He must be wearing the same pink designer hoodie and matching sweatpants outfit from Image 3, relaxed posture with his hands resting naturally. Transform the vehicle interior so it matches the ultra-luxury Maybach interior from Image 2: • white quilted leather executive seats • luxury center console • ambient LED lighting • illuminated luxury panels • fiber-optic starlight headliner ceiling • ultra-premium limousine interior atmosphere Cinematography should look like it was captured on an ARRI Alexa 35 cinema camera with a Cooke anamorphic cinema lens. These cameras are widely used in major films because of their extremely high dynamic range and natural cinematic color science. Lighting should feel cinematic and natural, with subtle reflections on the car window glass and soft luxury interior lighting illuminating the subject. Depth of field should be very shallow, creating creamy optical bokeh in the background, with the luxury ambient lights and starlight ceiling softly blooming into cinematic light circles. Focus should be tack sharp on the subject's face, while the interior lights blur smoothly in the background with natural lens bokeh characteristics. Shallow depth of field like this helps separate the subject from the environment and creates a strong cinematic look. Ultra-photorealistic skin rendering: visible pores, natural skin texture, subtle imperfections, realistic light falloff across the face. Luxury editorial photography aesthetic, high-end automotive lifestyle shot, natural reflections in glass, cinematic contrast, filmic highlight roll-off. 8K photorealism, ARRI Alexa cinematic color science, shallow depth of field, natural lens bokeh, subtle film grain, realistic optical lens imperfections.

Phase 2: Record Your Motion Reference Video

- 7 **Study the AI-generated image carefully** — note the exact seated position, camera angle, and body framing
- 8 **Film yourself performing/rapping** in the same seated position. Match the angle as closely as possible — sit on a couch, chair, car seat, whatever works
- 9 **Keep your body within frame** the same way it appears in the AI image — if you're seen through a car window, stay within that window's bounds

Motion Reference Video (Screenshot)

Film yourself in the same seated position as the AI image — your real movements drive the animation. Background doesn't matter.

⚠️ Position Matching is Critical: The closer your real video matches the AI image's angle and framing, the better Motion Control will lock on. Don't worry about your background or outfit in the reference video — only the position and movement matters.

Phase 3: Motion Control (Create Studio)

- 10 Go to sniply.studio → Create Studio → **Motion Control**
- 11 **Upload the AI-generated scene image** as the source image
- 12 **Upload your motion reference video** as the motion source
- 13 **Write a context prompt** describing the action — this is crucial for preventing artifacts (see prompt below)
- 14 Hit **Generate** and let Motion Control work its magic

💡 **The Context Prompt Trick:** Always describe what's happening in the scene (e.g., "a man rapping inside of a car"). This gives Motion Control environmental awareness so it doesn't morph your hands through the window or distort the car interior. Without this context, you'll get weird artifacts at the edges.

PROMPT 2 — MOTION CONTROL CONTEXT PROMPT

📋 **MOTION CONTROL PROMPT (EXACT)**

A man rapping inside of a car

💡 **Keep the Motion Prompt Simple:** The Motion Control context prompt doesn't need to be long. A simple description of the action and environment is enough. It just needs to know the person is **INSIDE** a car so it constrains the movement correctly.

🎨 **Make It Yourself — Your Version**

Swap in your own details to create YOUR luxury car music video scene. This works with any vehicle, any interior, any vibe.

🔧 **Step 1: Fill In Your Details**

Element

~~Our Example~~

Replace With Yours

Luxury Vehicle	Mercedes-Maybach with starlight ceiling	Rolls Royce, Bentley, Lamborghini, private jet — any luxury setting
Interior Details	White quilted leather, ambient LEDs, starlight headliner	Red leather, wood trim, champagne holders — describe the interior you want
Your Outfit	Pink designer hoodie + matching sweatpants	Whatever you're wearing in your identity photo — it carries over
Camera Angle	Through slightly lowered car window, backseat	Front seat, through windshield, interior POV — any angle that looks fire
Lighting/Mood	Cinematic night, ambient interior LEDs, shallow DOF	Golden hour, neon city reflections, dark moody, sunset — set the vibe
Action	Rapping	Singing, vibing, looking out window, counting money — whatever fits your track

Step 2: Build Your Scene Prompt

YOUR TEMPLATE — FILL IN THE BLANKS

Use Image 1 as the composition reference, Image 2 as the luxury **[VEHICLE TYPE]** interior reference, and Image 3 as the identity reference for the person. Replace the person in Image 1 with the **[man/woman]** from Image 3 while preserving **[his/her]** exact facial identity — same facial structure, skin tone, **[facial features]**, and proportions. **[His/Her]** face must match the identity reference one-to-one without altering facial features. **[He/She]** is seated naturally in the **[backseat/front seat]** of the vehicle, viewed through **[the slightly lowered car window / the windshield / interior angle]**, maintaining the same camera angle and framing as Image 1. **[He/She]** must be wearing the same **[YOUR OUTFIT DESCRIPTION]** from Image 3, **[relaxed posture / leaning back / looking out window]**. Transform the vehicle interior so it matches the ultra-luxury **[VEHICLE]** interior from Image 2: • **[INTERIOR DETAIL 1]** • **[INTERIOR DETAIL 2]** • **[INTERIOR DETAIL 3]** • **[INTERIOR DETAIL 4]**. Cinematography should look like it was captured on an ARRI Alexa 35 cinema camera with a Cooke anamorphic cinema lens. Lighting should feel cinematic and natural, with subtle reflections on the car window glass and soft luxury interior lighting illuminating the subject. Depth of field should be very shallow, creating creamy optical bokeh in the background. Ultra-photorealistic skin rendering: visible pores, natural skin texture, subtle imperfections. 8K photorealism, ARRI Alexa cinematic color science, shallow depth of field, natural lens bokeh, subtle film grain.

Step 3: Build Your Motion Control Prompt

YOUR TEMPLATE — SIMPLE CONTEXT

A **[man/woman]** **[rapping/singing/vibing]** inside of a **[car/limousine/SUV]**

Key Rules for Best Results:

1. **Position match your reference video** — sit in the same angle as the AI scene
2. **Keep movements contained** — stay within the frame boundaries (window, seat area)

3. **Always include a context prompt** — tells AI you're inside a vehicle to prevent morphing artifacts
4. **Your outfit in Image 3 carries over** — dress for the scene when you take your identity photo

✨ The Complete Workflow

- 1 **Gather 3 reference images** — composition angle, luxury interior, your identity photo
- 2 **Generate AI scene** — Nano Banana Pro with the detailed prompt → photorealistic luxury car image
- 3 **Record motion video** — Film yourself performing in the same seated position as the AI image
- 4 **Motion Control** — Feed AI image + motion video + context prompt → animated luxury car scene
- 5 **Add your track** — Layer your song over the final video, sync the performance, post everywhere 🔥

POV: shooting music videos in 2026 using AI

 Final Result: Motion Control in Action

Top: AI-animated luxury car scene with your real movements. Bottom: The actual reference video from your couch. Same energy, completely different world.

Luxury Vehicle Ideas

-  **Mercedes-Maybach S-Class** — Starlight headliner, white quilted leather, champagne cooler, ambient LEDs. The ultimate rap video car.
-  **Rolls Royce Ghost/Phantom** — Starlight ceiling, lambswool floor mats, bespoke everything. Old money energy.
-  **Lamborghini Urus** — Alcantara interior, Y-shaped vents, aggressive red/black. High energy tracks.
-  **Bentley Continental GT** — Diamond-quilted leather, rotating display, wood veneer. Smooth R&B vibes.
-  **Private Jet Interior** — Not a car, but same technique works. Cream leather seats, oval windows, wood grain. Boss level.

Pro Tips

💡 **The ARRI + Cooke Prompt Trick:** Mentioning specific cinema cameras (ARRI Alexa 35) and lenses (Cooke anamorphic) in your prompt triggers the AI to apply cinematic color science, natural skin tones, and realistic lens characteristics. This is what separates "AI image" from "cinematic photo."

💡 **Night Scenes Hit Harder:** Luxury car interiors look best at night — the ambient LEDs, starlight ceiling, and interior lighting create natural contrast against the dark exterior. Daytime scenes work but nighttime = automatic mood.

💡 **Multiple Cars, One Session:** Record ONE performance video, then generate different luxury interiors with the same identity photo. One take = Maybach, Rolls, Lambo, private jet — unlimited scenes.

💡 **The Shallow DOF Sell:** Describing shallow depth of field in your prompt makes the AI blur the background interior lights into creamy bokeh circles. This is what makes the image look like it was shot on a real cinema lens instead of AI-generated.

⚠️ **Common Mistakes:**

- **Not matching position** — If your video angle doesn't match the AI image, Motion Control will struggle to lock on
- **No context prompt** — Without telling Motion Control you're "inside a car," hands and body parts can morph through the window
- **Too much movement** — Keep it natural. Subtle head movements, hand gestures within frame. Don't lean way out of the car window area.
